an art form that will really move you.
The Corvette Convertible is the sports car most Americans have fantasized about owning. In 1992, a lucky few will realize the dream.
Corvette ZR-1 is the most talked-about sports car in a generation. It is also the car that makers of Porsche, Ferrari and Lamborghini don’t want to talk about.
Imagine two days at the GM Proving Grounds with three new 1992 Corvettes and no speed limit. It was a tough assignment, but somebody had to do it, reports Don Sherman, editor-at-large of Motor Trend magazine.*

*The text appears exactly as in the 1992 Corvette brochure.
Place three 1992 Corvette pilot-production models at the General Motors Proving Grounds near Milford, Michigan. Add the expertise of two congenial Corvette engineers. Gain carte-blanche permission to compare and contrast the dynamic personalities of this illustrious trio on a variety of test tracks. Persuade my boss that this is not another car-nut picnic, this is work.

to Don Sherman.

A flaming-red 6-speed 1992 Coupe is the star of the Corvette set. Engineers Scott Allman and Jim Ingle explain that, while the design is basically unchanged, there's plenty of new technology to sharpen the reflexes of this mainline model: a new, more powerful engine under the hood, new tires, revised shock absorbers with FX3 Selective Ride Control, and a traction-control system called ASR, which Jim Ingle tells me stands for Acceleration Slip Regulation.

Supporting members of the cast are an aqua convertible and a screaming-yellow ZR-1. The Corvette Convertible is the ultimate dual-purpose machine: there is no finer way to enjoy both driving and nature at once. The ZR-1, on the other hand, is the maximum Corvette for those who take their performance very seriously.

We meet at the Seven Sisters, a tight road course that reminds me of a horizontal roller coaster.

The radii of the seven close-knit curves range between fifty and seventy feet. Some are flat, a few are aggressively banked.

I begin with the Coupe. By the time I kiss but two of the Sisters, it's clear that the new Goodyear GS-C tires, which have a tread pattern that's both asymmetrical and directional, have remarkable grip and very predictable breakaway characteristics.

This is an ideal location to study the new ASR traction-control system. This system uses wheel-speed sensors to warn that one or both rear wheels are beginning to lose traction due to overenthusiastic throttle applications. A computer automatically rectifies that situation by first retarding ignition timing, then, if necessary, closing the throttle and applying one or both rear brakes.

There's an ASR button just above the headlamp switch which
I turn off for test purposes. I'm a strong believer in equality, so I aim the Corvette Coupe with even amounts of steering wheel and throttle. It realizes through the Seven Sisters like a Dance Fever grand champion. Of course, there are times when it isn't appropriate to flick the tail wide exiting every corner. To study this side of the Corvette's personality, I switch the ASR on. The Corvette now behaves itself like a well-disciplined child.

All 1992 Corvettes are equipped with ASR, including the Convertible. This car seems to say, "Why hurry?" on the Seven Sisters. I let the four-speed automatic and the grippy Goodyear tires do the work and cruise through for the cameras. Fluffy clouds and the bright Michigan sky smile down upon me. Corvette roadsters have to be the ride of choice in heaven.

I snap back to reality and strap on the ZR-1 for a run. The art director's driving instructions: "There is no such thing as modesty in a ZR-1." I ricochet from corner to corner like the steel ball in a pachinko machine. Next, we visit Black Lake, formerly known as the Fenn Holden Vehicle Dynamics Test Facility. This 57-acre monument to asphalt engineering is one continuous expense of pavement with no curbs or light poles to interrupt the handling and maneuverability tests.

To further explore the new traction-control system, I park the ZR-1 on a pair of six-foot-long polished-steel pads which do an excellent job of simulating glare ice. First, I switch the ASR off, engage the clutch, and stand on the gas. The result is exactly as expected: runaway rear-wheel spin causing the Corvette to drift a few inches to the right as it slowly creeps forward off the pads. Then I repeat the exercise with ASR activated. The rear tires chirp softly but the car moves forward straight and true. ASR doesn't entirely eliminate wheel spin, but it does
an excellent job of minimizing the ill effects such as diminished lateral stability.

The major development under the hood is a new LT1 engine which powers all Corvettes except the mighty ZR-1. Ingle explains, “This is a major overhaul of the classic small-block V8. The displacement is still 5.7 liters, but the package is physically smaller and more powerful. Both the water pump and the distributor are mounted to the front of the block and driven internally by the crankshaft. There’s a new low-profile intake manifold and an exhaust system that’s quite similar to what we’re using with the LT5 engine.” With 300 horsepower at the redline, I can’t wait to stretch my leg muscles against the throttle, so we transfer to Milford’s two-mile-long straightaway for a taste of pure speed.

I take a leisurely drive in the Corvette Convertible to learn the track. This may be the most charismatic Corvette in the lineup, but it doesn’t ignore its sporting credentials. When I floor the throttle, the new LT1 engine runs for the redline. The transmission clicks off each upshift firmly and punctually. I leave the pedal on the carpet and watch the speedometer digits count up to 130 mph.

Moments later, in the yellow ZR-1, the 375 HP, 32-valve LT5 engine performs its patented disappearing act: one second I’m sitting at the start of the straightaway, the next instant I’m gone. There is so much ihrust available between 4000 and 7000 RPM that I wouldn’t be surprised to find a “NASA” label positioned discreetly under the ZR-1 hood.
To finish the day, I buzz the red coupe up to an indicated 142 mph. The LT1’s energetic horsepower curve matched to the six-speed manual transmission is a marriage worthy of The Love Boat. Cherry fans faithful to the small-block engine for more than three decades reap their reward in 1992. Especially those lucky enough to own a new Corvette.

**Retrospective: The ’70 Corvette LT1**

The new-for-1982 Corvette LT1 V8 is a spiritual successor to a legend among legends ... the 1970 350-cubic-inch LT1 V8.

The original LT1 was a limited-production performance option available in Corvette from 1970 through 1972, and represented the peak of “small-block” V8 performance for that era.

In 1970, the LT1 was the enthusiast’s alternative to tamer 350s and comparatively bruish 454 “big block” engines. The uncompromised nature of the LT1 was revealed in the option restrictions: 4-speed manual transmission only and no air conditioning. The LT1 was built to run — right to a 6500 RPM redline, and it made all the right sounds in the process. At 370 gross HP, this was easily the most powerful small-block Corvette V8 yet.

Twenty-some-odd years later, driving a ’70 LT1 takes a little adjustment. You sit down low, way down low. The steering wheel seems large and skinny. Then you turn the key ... and the real memories come flooding back.

The ’70 LT1 V8 is a wonderful toy: massive torque at the low end and seemingly endless RPMs up high. Even by today’s standards, the ’70 Corvette is a surprisingly capable, all-around performer. Brakes are four-wheel disc. The suspension is fully independent. Instrumentation is complete.

What’s missing? About two decades of refinement. Corvettes have come a long way since 1970.

"What we learn on the track is reflected in the Corvettes you’ll be driving on the street," says Scott Allman.
This classically American sports car continues to win the hearts of enthusiasts and the respect of competitors.
Althought it hardly seems possible, there was a time (circa 1953-54) when Corvette was scoffed at by those who thought a proper sports car was something Europeans knew best.

Today, the cognoscenti know better.

And they will love the 1992 Coupe, for this car surpasses the Corvettes of yore with a new 300-HP LT1 version of the 5.7 Liter V8, a smooth-shifting 6-speed manual transmission, a new high-performance traction-control system and new 17-inch Goodyear Eagle GS-C tires tuned for excellent ride and response.

Corvette style? Let's just say the mystique is still there.

The 1992 Coupe is also one of the world's most completely equipped sports cars. Standard equipment includes air conditioning, power windows, power door locks, and a Delco AM/FM stereo with cassette tape player. A standard "delay" feature for accessories continues power to the entertainment system and power windows for up to 15 minutes after the ignition key is turned to "off" or until either door is opened.

Other convenience features include halogen fog lamps, front and rear cornering lamps, and dual sport mirrors (electric remote and heated).

The Coupe's one-piece removable roof panel may be lifted off for breezy, open-sky motoring. A transparent roof panel (with blue or bronze tint) is an available option. The all-glass lift-up rear hatch with remote release allows easy access to 12.6 cu. ft. of luggage space. A security shade is included, and additional storage space is provided by a lockable storage compartment behind the passenger seat.

Corvette for 1992 retains the widely praised 1991 exterior design (revised rear appearance with quad rectangular tail lamps, wraparound front cornering lamps, aggressive 17" aluminum wheels and restyled front fender louvers). Base-coat/clear-coat paint (on fiberglass body panels, of course) provides a "wet-look" shine.

What's new is what's under the hood... a powerful new version of the 350 cubic-inch (5.7 Liter) V8. It's the latest in a long, proud line of Corvette V8 engines.
The one-piece removable roof panel gives Corvette both open-air flair and the security of a closed car. A transparent panel is optional.

Corvette Coupe for 1992 combines classic American style with LT1 V8 performance.
The new-for 1992 LT1 is the latest version of the legendary Corvette small-block V8. Horsepower is 300 at 5000 RPM; torque is 330 lb-ft at 4000 RPM.

The LT1 cylinder head is aluminum; basic block is cast-iron.

A new one-piece low-profile intake manifold provides increased engine volumetric efficiency, i.e., better "breathing."

Angle-based ignition system and a recontoured fuel rail result in greater power delivery at high RPM.

A low-friction accessory drive helps air conditioning and power steering operate more efficiently, drawing less power from the engine.

New Multi Port Fuel Injection system contributes to improved fuel flow, more precise mixture of fuel and air in the combustion chamber, and excellent throttle response.
The new LT1 V8 for '92...

The goal in designing the 1992 LT1 engine was to keep Corvette clearly world-class, in terms of overall power, acceleration, smoothness of power delivery and reliability. The resulting engine surpassed even the engineers' high expectations. In fact, after a quick ride in a prototype, a development engineer remarked, “It reminds me of the '70 LT1” (a high-performance small-block V8 engine available on Corvette from 1970 through 1972 in limited numbers). And that’s how the new 1992 engine received its classic designation: LT1.

The basic configuration and block are the same as in 1991, and also the same as the 1970 LT1: 350 cubic inches of displacement with a bore/stroke ratio of 4.00 x 3.48. From this highly satisfactory starting point (with a 1991 HP rating of 250 at 4400 RPM), the Corvette team went to work. They added a new one-piece low-profile intake manifold and new air cleaner cover for improved engine “breathing,” a new front cover and water pump for increased efficiency, angle-based ignition timing and recontoured fuel rail for greater horsepower at high RPM, and a new low-friction accessory drive. This serpentine-type accessory drive belt is designed to outlast conventional belts.

Engine cooling system improvements include a new cylinder head gasket, thermostat and seal assembly. A new-for-1992 Multi-Port Fuel Injection system contributes to improved fuel flow and precise throttle response.

The bottom line: 300 HP at 5000 RPM. Not only is that a 50 HP increase from 1991, it is also more HP than the 1970 LT1 delivered. The 1992 LT1 V8 is one of the most powerful small-block...
Corvette V8s ever created. That's saying something, especially when you consider that this new engine runs more cleanly and on lower octane gasoline than the Corvette V8s of years ago.

The LT1 V8 is available with your choice of a four-speed automatic overdrive transmission (standard) or a remarkably smooth-shifting 6-speed manual (a no-cost option).

**Traction Control**

Acceleration Slip Regulation, a computer-controlled traction-control system which provides optimized acceleration and vehicle directional stability, is standard in every 1992 Corvette. When wheelslip is detected, the traction-control system pulses the anti-lock brakes and momentarily reduces engine output via engine spark retardation until wheel and ground speed are nearly matched to provide well-balanced performance and greater control on a variety of road surfaces.

Traction Control, combined with a standard limited-slip rear axle and new, asymmetrical, unidirectional 17-inch Goodyear Eagle GS-C tires, maximizes the real-world potential of the LT1 V8.
An advanced six-speed manual transmission features a dual-pivoted shifter for a fast, narrow shift pattern that's sure to please manual-gearbox fans. help you maintain steering control even in a panic stop in rain, on snow or on ice. When called upon to do so, the four-wheel anti-lock brake system can adjust brake pressure as rapidly as 15 times per second, a rate even the most skilled professional driver cannot attain. Bosch ABS IIS is combined with four-wheel power discs for up to 1.0g of stopping power.

**Selective Ride Control**

Corvette's optional Selective Ride Control, refined and recalibrated for 1992, is an innovative suspension system designed for everyday driving. This computerized system allows the driver to select from one of three shock absorber damping levels (Touring, Sport or Performance) via a console-mounted switch. It is programmed for six automatic gradations of firmness within each mode, with firmness increasing as vehicle speed increases.

**Four Wheel Anti-Lock Brake System**

Standard in every Corvette is the Bosch ABS IIS, one of the most advanced four-wheel anti-lock brake systems available in any production automobile. ABS reduces the chance of wheel lockup during braking and is designed to

Standard PASS-Key®

All 1992 Corvettes feature a standard Personalized Automotive Security System (PASS-Key). This totally passive system uses a small resistor pellet embedded in the ignition key with a specific resistance value. If an attempt is made to start the car without the proper key, the starter motor and fuel flow are rendered inoperative, preventing the car from being started for up to four minutes each time a key with the wrong resistor is used. In addition to reducing vehicle thefts, the PASS-Key system may qualify you for comprehensive insurance premium discounts. Ask your agent.

Standard Safety Features

Occupant safety is a top priority in the design of the Corvette Coupe. Advanced safety features include a rugged steel safety cage that surrounds the passenger compartment, a driver-side air bag, lap/shoulder safety belts for both driver and passenger, and controlled-crush front and rear structures.

All 1992 Corvettes

Feature a standard GM-developed Personalized Automotive Security System (PASS-Key).

A driver-side air bag is standard in every 1992 Corvette.

It can help protect the driver in certain frontal collisions. The air bag is a supplemental system only and is designed for use in conjunction with safety belts.

An advanced four-wheel anti-lock braking system (Bosch ABS11S) gives the '92 Corvette stopping power to complement its performance potential.
Corvette is the official vehicle of America; a designed-in-the-U.S.A. entry in the 1992 America's Cup yacht race.

Consider the '92 Corvette Convertible another all-American, wind-in-the-face challenge to conventional thinking.
Just the sight of America³, with sails taut, knife through whitecaps at full speed, is guaranteed to get the adrenaline flowing. Especially if you’re along for the ride.

Corvette Convertible is a lot like that. Picture yourself (and your favorite companion) in this car, with the open road ahead of you. Now, drop the top. Put your favorite tape (or compact disc) in the optional Delco/Bose player. Enjoy the mellow background music of the finely tuned LT1 V8, and feel the rush of the wind.

If ever there was a year to realize the dream of owning the Corvette Convertible, it is 1992.

The technology...

The style of this Corvette is sensational. The romance of top-down motoring is timeless. But it is the performance that makes this roadster a sports machine to be savored. The new 5.7 Liter LT1 V8 transmission is standard equipment. A ZF 6-speed manual transmission is a no-cost option. Both transmissions receive calibration changes for compatibility with the new LT1 engine. A significant
feature of the 6-speed manual is Computer-Aided Gear Selection (CAGS). The CAGS system is designed to improve fuel efficiency during normal driving situations by directing the driver from first gear to fourth gear when accelerating lightly from a dead stop. A rapid acceleration cancels the one-to-four shift automatically.

PASS-Key, the most sophisticated theft-deterrent system in Corvette history, is standard equipment. Since making its debut on the 1986 model, the totally passive PASS-Key system has reduced Corvette theft rates by 23 percent. PASS-Key may qualify you for comprehensive insurance discounts. Ask your agent.

The luxury...

You will also appreciate the convenience and comfort built into this Convertible. Standard features include power windows, air conditioning, TILT-WHEEL™ Adjustable Steering Column and a superb Delco AM/FM stereo with cassette tape player. Two Delco/Bose music systems are available. The first system adds six tuned Bose stereo speakers and 200-watt power to the features of the standard stereo. The top-of-the-line Delco/Bose music system includes speed-activated volume control and a stereo digital compact disc player.

A standard delay feature for accessories continues to supply power to the entertainment system and power windows for up to 15 minutes after the ignition key is turned to the “OFF” position or until the driver’s door is opened — whichever occurs first. luxury. Interior options include bucket seats with leather seating surfaces, sport bucket seats and electronic-digital-control air conditioning. A lockable storage compartment is located behind the passenger seat, with additional storage space for small items in the lockable center console and glove compartment.

As in every Corvette, a quieter-for-1992 ride is achieved via refined sound-deadening materials, improved engine isolation, and new Goodyear GS-C high-performance tires. The optional low-tire-pressure warning system monitors air pressure in each tire continuously while the vehicle is being driven. Should tire pressure fall below a predetermined point, a warning lamp in the Driver Information Center is illuminated.

The easy-folding manual convertible top features an integral headliner that is designed to reduce road and wind noise. The soft-top disappears below a fiberglass panel when lowered. Choose from four top colors, depending on exterior color selected: Black (canvas), White (vinyl), Light Beige (canvas) or Blue (canvas). A new Arctic White bucket-seat interior with leather seating surfaces is optional. This option, exclusive to convertibles, is available with seven out of nine Corvette exterior colors.

Worthy of note: this is a factory-built convertible, manufactured to strict quality standards at the Corvette plant in Bowling Green, Kentucky.

A body-color removable hardtop is a popular option you may also wish to consider. The lightweight (64-lb.) fiberglass hardtop features a cloth headliner and electric rear-window defogger. Another option available exclusively on the Convertible is the factory-installed rear deck-lid carrier. This black-finished carrier adds both style and cargo capacity.

There have been many great performance moments in the evolution of the Corvette roadster ... the '57 "fuelie," the '62 "327," the '67 tri-power "427," and the '70 LT1 are notable examples. Now the '92 LT1 Convertible is here, and we invite you to own this moment in Corvette history.
To many, the Corvette Convertible is the Corvette.

In 1992, with the new LT1 V8, it becomes even more of a moving experience.
Tradition, Technology and Teamwork

For the international yachting community, the America’s Cup is the Super Bowl, World Series and Indy 500 all wrapped up into one. And in 1992, Corvette is sponsoring one of the American syndicates – the America³ Foundation.

The Corvette logo might not be flying on the spinnaker of America³ if it weren’t for what happened back in 1851 on a summer afternoon at Cowes on the Isle of Wight. There, an upstart team aboard the schooner America soundly thrashed 16 other British yachts, all in front of a consternated Queen Victoria. The America’s Cup was born.

After the Americans tooted the 134-ounce silver urn across the Atlantic, it remained for the next 132 years at the New York Yacht Club despite numerous foreign challenges. But the Cup probably wouldn’t have a firm place in the American psyche now, if it weren’t for the Australians beating American Dennis Conner in 1983 with the boat Australia II and its famous winged keel.

Dennis Conner and his boat, Stars and Stripes, then went down to Fremantle, Australia, in 1987 to win the Cup back again, and since then the Cup has resided at the San Diego Yacht Club. In 1988, the New Zealanders thought they saw a way to catch the Americans napping, issuing a short-notice challenge which was answered by Conner’s own custom-made loophole – a catamaran. Conner then soundly whipped the Kiwis, only to be challenged in court. After a protracted battle, Conner won. Which brings us to 1992. Given the publicity of the last decade, teams from more countries than ever before are interested in claiming the Cup. The toughest competition is expected to come from the Italians, New Zealanders, Japanese and Australians.

Who will represent America³? That remains to be decided, but two teams are vying for that honor – Dennis Conner and his Stars and Stripes and the America³ team led by Bill Koch.

How you win the America’s Cup, says Koch, can be considered a microcosm of what it takes to be successful in life. “It combines a whole number of elements. Science, athletic skill, being very close to nature, good organization, good execution and a good sense of teamwork.”

How did the team name America³ originate? “Well, Bill’s first racing boat was named Matador,” says ESPN commentator Gary Jobson. “And when he came up with a new boat, he named it Matador³, as opposed to Matador II. In other words, he squared the potential of the boat. And Bill being an MIT guy with a Ph.D. in engineering, he liked the cleverness and the mystery of the exponent.”

“The other aspect,” says Jobson, “is the current trend towards patriotic names – Stars and Stripes, Heart of America, they’re all symbolic of a patriotic theme that is popular today.”

Why is someone like Bill Koch making this tremendous investment in time and money? “He is a true Corinthian sportsman,” says team deputy chief operating officer Rick Wrightson. “He’s not doing it for the money or for the prestige. He’s doing it with a scientific mind because he likes research in pursuit of excellence; he likes to try to prove things.”

To that end, Bill Koch has put the best of American technology and teamwork up against the same from the rest of the world. “The question is: can we compete against the world’s best and emerge victorious? I firmly believe we can,” says Koch, with the tenacity of a man with vision.
"We're just ordinary people doing extraordinary things." - Bill Koch

“You don’t have to be the very best at what you do, just do it reasonably well and don’t make any mistakes.”

The speaker is Bill Koch (pronounced “Koke”), Ph.D. from MIT, CEO of the Oxbow Corporation, the head of the America's Cup Foundation, skipper of America², and the man whose vision is rapidly becoming reality on the waters off San Diego.

Koch's statements say a lot about how he views the world. A quiet man, rich by any definition of the word, Koch is a relative newcomer to this sport of yachting, yet his learning curve must be positively frightening to his competitors in the yachting world.

Q: Why yacht racing?
A: It combines almost everything you would encounter in any kind of human endeavor.

Q: From your vantage point (as a successful entrepreneur in several fields) what in life compares with yacht racing?
A: Nothing in sports. I'd liken it to business or conducting a war. Probably more like business because there you can have friendly competitors and in war, you're out to do the other guy in.

Q: Why have you been so successful, versus others who've been doing this most of their lives?
A: Well, one of the keys is that sailing is both a science and an art and you've got to combine the two. Most people look at it as an art, but then they're missing out. If you look at it purely as a science, you're also missing something. But what I've done is to bring a very disciplined, scientific approach to it.

The other thing is to emphasize teamwork, getting people to work together for a common goal. We found that if we got a whole bunch of the best sailors in the world and put them on a very fast boat, they didn't do very well. But if you got a bunch of guys who were mediocre sailors with good attitudes who were willing to work together and put 'em in a fast boat, they started winning.

We have three criteria for selecting people on the team. First is attitude, second is teamwork and the last is ability. As you can see, attitude and teamwork far outweigh ability on this team.

Q: You mention a fast boat as part of a winning equation. What percentage of a winning formula in yacht racing is technology?
A: I would say it is 60 percent technology and 40 percent human. Having a fast boat is like having a fast car. The key in sailboat racing is having a fast boat and making no mistakes.

Q: Some critics are saying the sport is becoming too expensive. How do you feel about that?
A: I'm one of those critics, I think the same results could be accomplished with much less expensive boats and materials.
"America³ is a floating research lab." – Dr. Heiner Meldner

Some people are attracted by the aesthetics and tradition. Others by the precision and teamwork. But to America³ technical director Dr. Heiner Meldner, there’s a higher purpose.

Dr. Meldner, a native of Germany, is a nuclear computational physicist by trade and a veteran of the Strategic Defense Initiative (Star Wars) program. He got involved in sailing while teaching physics at the University of California/San Diego and now coordinates the efforts of some 40 technicians on the America³ program.

To Dr. Meldner, the boats are really floating research labs, testing things like fluid dynamics, wind forces as they translate to the hull, composites and sail shape, structure, and materials. While Dr. Meldner’s research and development could well trickle down into the kinds of sailboat designs that consumers can buy in the future, its primary purpose is to propel the America³ Foundation into the 1992 America’s Cup finals.

Dr. Meldner has his work cut out for him. Full frontal assaults are expected from the Italians, New Zealanders, Japanese and Australians, not to mention Bill Koch’s American archrival, Dennis Connor, and his Stars and Stripes team.

But armed with a budget of approximately $40 million, the America³ Foundation has the resources to win. To that end, they are testing multiple approaches to boat design. One of their boats was built by Hercules Aerospace in Salt Lake City, Utah. Yet another boat is being built by a more traditional marine builder, Eric Goetz’s yard in Bristol, Rhode Island. The team also maintains research offices at Stanford University in Palo Alto, California, and at the Massachusetts Institute of Technology.

“We’re running a lot of experiments at this stage,” says Dr. Meldner. “It’s very difficult for me to tender any kind of actual qualitative discussion because that would tip off our competitors. But I can tell you we’re on target.”

Will there be any application of this research to a future Corvette? Meldner is optimistic.

“The goals are very similar,” says Dr. Meldner. In boat and car design, you want great strength and light weight.

“An interesting thought is that race boats up until two or three years ago were all glass boats. In 1987, the only composites were fiberglass boats. That was partially a consequence of the rules. It wasn’t until 1988 or 1989 that the first Maxi boat was carbon fiber.

“Maybe in five years all Corvettes will be made out of carbon. I think it will happen sooner or later.” Time will tell whether Dr. Meldner is right regarding a Corvette we all can buy.
The super car was once, by definition, a European specialty with an unpronounceable name. Today, the balance of power belongs to America and the Corvette ZR-1.
The Corvette ZR-1 was introduced just two brief years ago, and the pecking order in exotic cars hasn’t been the same since. Now, some stratospherically priced European machines are being relegated to also-ran status before this made-in-the-U.S.A. sports car. Perhaps permanently.

ZR-1 has graced magazine covers like no Corvette before it, and the automotive press still can’t get enough. The reason for the excitement is clear – this street-legal Chevrolet consistently generates performance numbers on the test track that were once the province of all-out race cars.

The LT5 Engine

At the heart of Corvette ZR-1: the already-legendary LT5 V8. This all-aluminum 5.7 Liter engine serves up specs that have enthusiasts (and competitors) paying careful attention. Each cylinder head has dual overhead camshafts with direct lobe-to-lifter contact, and four valves per cylinder. Fuel delivery is by micro-processor-controlled Multi-Port Fuel Injection with a 16-runner inlet manifold and two Multec injectors per cylinder. There is no distributor; ignition is via a four-coil “direct-fire” system.

Compression ratio is 11.0:1. Horsepower is 375 at 5800 RPM; torque is 370 lb.-ft. at 4800 RPM. The performance is, as you might expect, brisk. But the real beauty of the LT5 engine is its ability to combine this high-RPM ferocity with low-speed civility and quiet cruising-speed operation.

A multiple-throttle induction system contains the secret of LT5 tractability. Within each cylinder, the intake ports, valves and cam lobes are divided into two groups, the primary being the one toward the front and the secondary to the rear. Below half-throttle, or 3000
The all-aluminum LT5 engine is a totally uncompromised high-performance design. Features of this 5.7 Liter V8 include dual overhead camshafts (four total), 32 valves, and a dual-mode induction system.
RPM, the engine breathes through the primary ports only. So operation, in effect, is on three valves per cylinder. The secondary intake valve is also moving, but admits no fuel-air mixture. But when you put your foot down, there's a complete change in the ZR-1 personality. The secondary port throttle valves open to permit fuel-air mixture to enter the secondary intake valves. At this point, the engine is running on all 16 injectors and all 32 valves. The secondary intake valves, which are now admitting fuel-air mixture to the cylinders, are actuated by cam lobes, which have more duration than the "primaries." The effect is to provide true variable valve timing, optimizing flow and producing both tractable low-speed and impressive high-speed characteristics in a single engine. A unique Power Key, with the switch located on the center console, provides the ZR-1 owner with a choice of two engine settings. When "NORMAL" is locked in, the engine runs on the primary ports only. "FULL" mode allows secondary valve operation and full-out 32-valve performance. "NORMAL" mode limits the driver to about 210 HP.

**Traction Control**

This advanced-technology feature is standard in every 1992 Corvette. Traction Control is a computer-driven system that maximizes wheel traction to provide excellent acceleration and control on a variety of road surfaces.

**6-Speed Manual Transmission**

A smooth-shifting, highly acclaimed ZF 6-speed manual transmission is designed to heighten the performance of the 375 HP LT5 engine. Computer-aided gear selection (guiding you from 1st to 4th during certain light-throttle driving modes) and ratios carefully chosen for both maximum performance and low-RPM highway cruising are featured.

**ZR-1 Chassis Technology**

ZR-1's handling prowess is the result of a carefully tuned four-wheel independent suspension (with monoleaf front and rear transverse springs). Selective Ride Control, standard in ZR-1, improves on the razor-sharp reflexes of Corvette and offers sedan-like ride quality – when desired. Now asymmetrical and unidirectional tires are an integral part of the ZR-1 chassis dynamics. Front tires are P275/40ZR-17 and rears are P315/35ZR-17. The ZR-1 features distinctive bodywork (flared from the doors back) to accommodate the extra-wide rear tires. At the rear, the ZR-1 is wider than a standard 1992 Corvette. An all-disc four-wheel anti-lock brake system (Bosch ABS IIIS) provides stopping power to match the performance potential of ZR-1.
Corvette ZR-1 is the American sports car that has set new standards of performance for the production-line automobile.
ZR-1 rides on the widest
tires in Corvette history:
new Goodyear Eagle
GS-C P315/35ZR-17s
in the rear and P275/40ZR-
17s up front.

ZR-1 Standard Features
The 1992 ZR-1 is the most
completely equipped Corvette ever.
Standard equipment includes six-
way power sport seats, elec-
tronic-control air conditioning,
PASS-Key theft-deterrent system,
and a driver-side air bag. The only
options are a transparent re-
moveable roof panel or dual panels
(body color and transparent).

A world-class sports car is
deserving of a world-class sound
system, and ZR-1 gets it. The
standard Delco/Bose AM/FM
stereo Gold Series Sound system
includes electronic tuning, au-
tomatic up/down seek, six tuned
Bose stereo speakers and 200
watts of natural sound.

Other advanced features of
this Delco/Bose stereo include a
cassette tape player with auto
reverse, a digital compact disc
player and speed-compensated
volume adjustment. Dynamic
Noise Reduction™ (DNR) and
Dolby® Sound Noise Reduction are
designed to reduce high-frequency
"hiss" on AM/FM and cassette
tape player.

Is "more Corvette" your Corvette?
After driving the ZR-1, one
Corvette engineer nailed its defi-
nition: "ZR-1 is Corvette, only
more so." If you're ready for this
much Corvette, your Chevrolet
dealer would be delighted to show
you the 1992 edition of the
American champion.

Selective Ride
Control allows the driver
to select one of three
system settings (Touring,
Sport or Performance)
by rotating a switch on
the console panel.

The Power Key is an
exclusive feature of
Corvette ZR-1.

The "NORMAL" setting
limits horsepower to
about 210. When "FULL"
is dialed in, the maximum
potential of the LT5
engine is made available.

The "FULL" setting
helps improve vehicle
central during braking
in many adverse road
conditions by mini-
mizing wheel lockup.
A driving environment to delight enthusiasts and luxury lovers alike.
Corvette luxury is much more than fine leathers and excellent stereo systems. Corvette luxury is the art of making the driver actually feel as one with the machine.

The reclining bucket seats are contoured for comfort and for control. The optional sport seats with leather seating surfaces (standard in ZR-1) include power height, tilt, fore/aft adjuster, and a power lumbar support feature. Three new interior colors are available: Arctic White (Convertible only), Light Beige and Light Gray. Black (cloth or leather) and Red (leather only) are continued. A TILT-WHEEL™ Adjustable Steering Column is standard and the design of the instrumentation places a priority on visibility, legibility and ease of reach.

For 1992, a revised instrument cluster features bolder gauge graphics, with more precise graduations. Gauges include analog readouts for tachometer, water temperature, oil pressure, oil temperature and volts; and digital readouts for speed, volts, oil temperature, coolant temperature, instant average fuel economy and range. Another important driver-information system is an engine oil-life monitor. It alerts the driver with a “Change Oil” light when an oil/filter change is recommended. The low-oil sensor illuminates a “Low Oil” lamp in the Driver Information Center when the oil level is one quart low.

Available sound systems: a standard Delco AM/FM stereo with seek-scan, cassette tape player, digital clock and power antenna; two Delco/Bose systems are available: one with cassette player, and one with cassette player and compact disc player (the latter features speed-activated volume control and is standard in ZR-1).
The Corvette instrument panel.
Options shown include Delco/Bose stereo sound system with cassette tape player and compact disc player, and electronic control air conditioning.

IMPORTANT: A WORD ABOUT THIS CATALOG

We have tried to make this catalog as comprehensive and factual as possible. We reserve the right, however, to make changes at any time, without notice, in prices, colors, materials, equipment specifications, models and availability. Since some information may have been updated since the time of printing, please check with your Chevrolet dealer for complete details.

A WORD ABOUT ASSEMBLY

Chevrolets are assembled by different operating units of General Motors, its subsidiaries or suppliers to GM worldwide. Chevrolet incorporates thousands of components produced by different operating units of GM, its subsidiaries or suppliers to GM worldwide. We sometimes find it necessary to produce Chevrolets with different or differently sourced components than originally scheduled. All such components have been approved for use in Chevrolets and will provide the quality performance associated with the Chevrolet name. Since these options may be unavailable when your vehicle is assembled, we suggest that you verify that your vehicle includes the equipment you ordered, or if there are changes, that they are acceptable to you.

A WORD ABOUT UPDATED SERVICE INFORMATION

Chevrolet regularly sends its dealers useful service bulletins about Chevrolet products. Chevrolet monitors product performance in the field. We then prepare bulletins for servicing our products better. Now you can get these bulletins, too. Ask your dealer. To get ordering information, call toll-free 1-800-551-4123.

A WORD ABOUT CORROSION PROTECTION

Chevrolets are designed and built to resist corrosion. All body sheet metal components are warranted against rust-through corrosion for 6 years/100,000 miles. Application of additional rust inhibiting materials is not required under the corrosion coverage.

GM’s 3-year/36,000-mile limited warranty covers repairs for the 1992 Corvette, including labor and parts, to correct any defects in material or workmanship occurring during the warranty period. Warranty features include air conditioning repair, towing, no-cost warranty transfer, 6-year/100,000-mile body sheet rust-through protection and 5-year/50,000-mile emissions control system coverage. Items not covered include tires (which are covered by their manufacturer) and normal maintenance. See your Chevrolet dealer for terms of this limited warranty.

CHEVROLET ROADSIDE ASSISTANCE CENTER

The security of round-the-clock roadside assistance is available to every Chevrolet owner via a toll-free hot line. Your call will be answered by a Roadside Service phone advisor trained by Chevrolet and experienced with your car. You will be placed in contact with a nearby service center, and assistance with towing and other helpful services will be arranged. Please ask your Chevrolet dealer for more details.

CUSTOMER ASSISTANCE

Chevrolet’s Customer Assistance Center (CAC) has a special, toll-free 800 number. It puts you in contact with Chevrolet experts who can handle any product/service question or problem you may have. Call 1-800-222-1029, Monday through Friday, 8:00 a.m. to 7:30 p.m., Eastern Standard Time.

GM PROTECTION PLAN

The GM Protection Plan offers service protection in addition to that provided by GM’s new-vehicle limited warranty. Ask your dealer about it. Coverage available only in the U.S. and Canada.

At your Chevrolet dealer, financing or leasing your new Corvette can be as easy as saying GMAC.
